

Assignment 1 – Logical Assumptions Document

For the meaning of each entity and attribute, refer to the index at the end of this document.

Assumptions

Assumption (how Monash Functions operates)	Decision (how it is reflected in the model)
Each room must have at least one corresponding evaluation to be in the system and offered to customers. (The brief says “When a new booking is being made for a particular function room, the room’s most recent evaluation is checked to ensure that the room can be used.”)	Hence the cardinality between room and evaluation.
From the brief: <i>The customer gets a 5% discount if the booking period is more than four hours.</i>	This can be derived using the book_start_time and book_end_time attributes.
If multiple chefs are assigned to a booking, exactly one of them must be assigned as a head chef (Y). If there is only one chef required for a function, then is_headchef attribute will be (NULL).	This is why is_headchef is marked as not mandatory
Checking for on-site parking is mandatory for all evaluations.	
The years of experience can be derived from the start year from when the chef first specialised in a cuisine.	speciality_start_year stores the year the chef first specialised in cuisine.
Base rate includes the cost of hiring chefs.	This is why we did not include chef hourly rate as an attribute in the database.
